

Content-Type Styling Run

2026-08-31 · branch `content-type-styling-plan` · plan: `plans/content-type-styling.md`
Scope: all content types supported so far, per `getContentStats` (2026-08-31, site TOTAL 9514). Object views only — listing displays remain blocked on the layout plumbing documented in the plan.
Method: Layer 1 shared partials in `themes/_shared/scss/content-types/`, scoped `body.portaltype-<type>`, derived from the live site's site-wide `ploneCustom.css` (+ computed-style measurements where no rules exist); compiled into all 15 sub-site themes. Authored by three parallel subagents with disjoint file ownership; integrated, validated, and visually verified centrally per the plan's subagent execution model.

Type	Count	Status	Partial	Verified on
product	50	Done (prior run 2026-08-30; layout lifted to shared this run)	<code>_detail-layout.scss</code> + <code>_product.scss</code>	lp-parent-site, wildland-fire, se-firemap
project	192	Done this run	<code>_detail-layout.scss</code> + <code>_project.scss</code>	wildland-fire
spatial_data	100	Done this run	<code>_spatial-data.scss</code>	gis-planning
organization	668	Done this run	<code>_organization.scss</code> (+ shared table chrome)	lp-parent-site
person	3129	Done this run (live visual reference pending — page private on live)	<code>_person.scss</code>	lp-parent-site (structural)
story	36	Done this run	<code>_story.scss</code>	aquatics
google_doc	45	N/A — <code>gdoc_view</code> is a bare frameset; nothing to style	—	—
video	0	Absent — importer still creates nothing (known blocked issue)	—	—

All "before" captures: local, logged in, 1660px viewport (≈1440px content beside the admin toolbar), full page. "Live" captures: `dev.landscapepartnership.org` at 1440px, full page, committed under `captured-themes/_content-types/<type>/screenshots/`. Empty table cells and missing images visible in "after" shots are content-import gaps (org lead images, person profile fields, project relations), not styling defects.

project — Catalina-Rincon Restoration (wildland-fire)

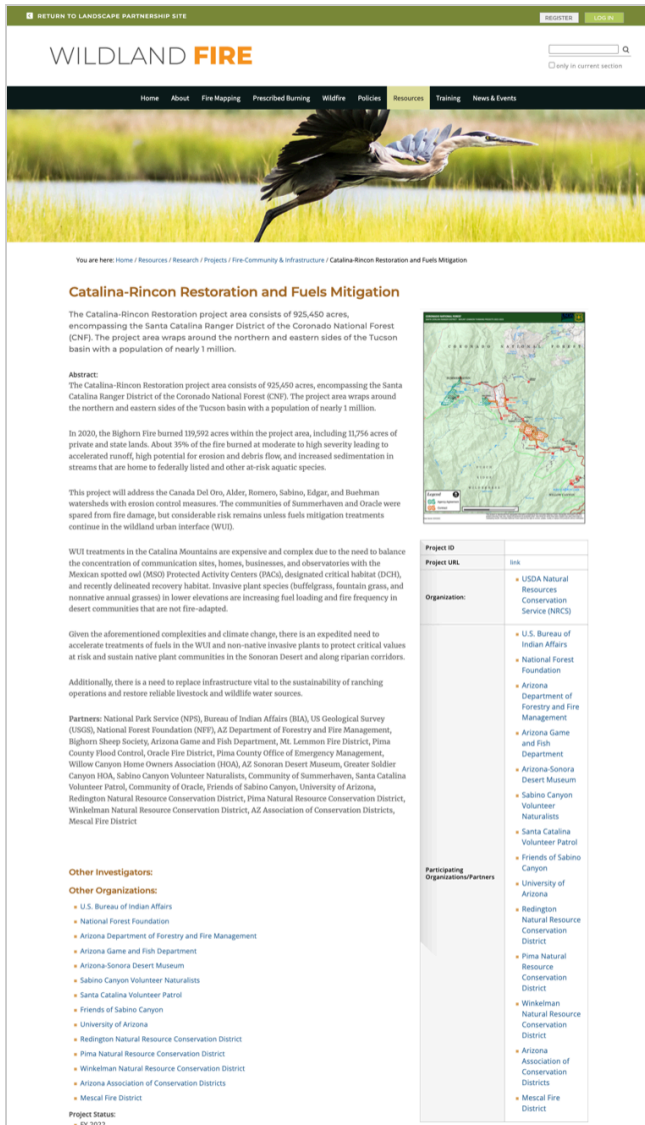

BEFORE (local)

LIVE REFERENCE

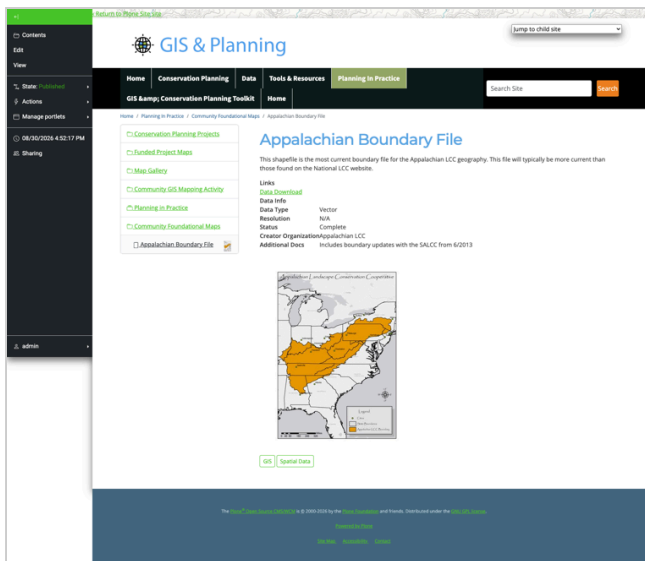

AFTER (local)

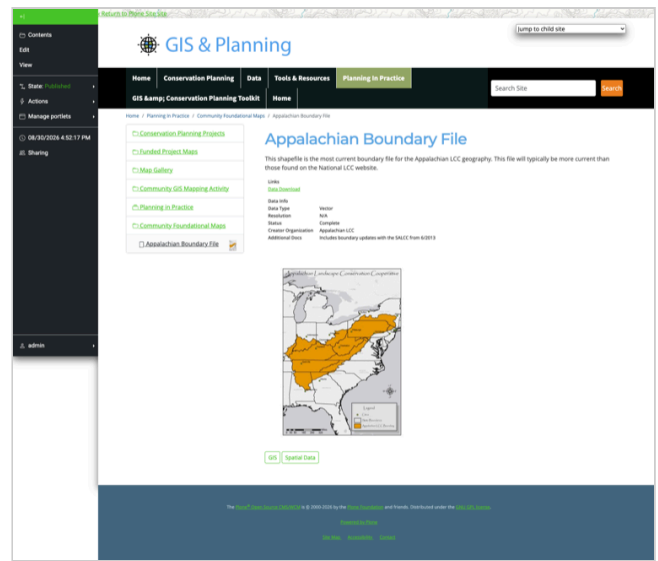

- `layout` Content flowed into the live 65/35 grid — text left, lead image + keyword table right (before: image and fields stacked full-width in source order).
- `typography` Field headings ("Abstract:") now 16px/500/margin-0 per live computed styles, instead of oversized theme h4s.
- `table` Keyword sidebar table gets the live chrome: #f9f9f9 ground, #ccc/#bbb borders, 8px 12px cells, #e0f8fe row hover, 400px cap.
- `lists` Keyword `ul/li` values flattened to live's comma-joined text.
- `dedup` All of the above ships from `_detail-layout.scss`, shared with product and organization — zero copy-paste between type partials.

spatial_data — Appalachian Boundary File (gis-planning)

BEFORE (local)

AFTER (local)

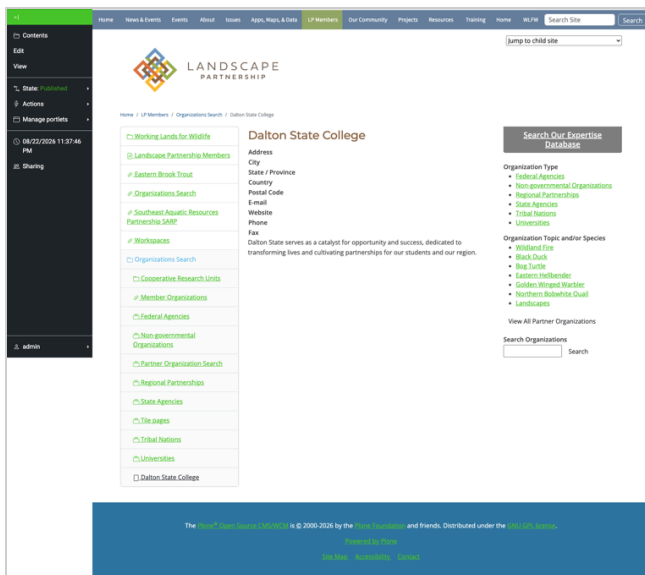

LIVE REFERENCE

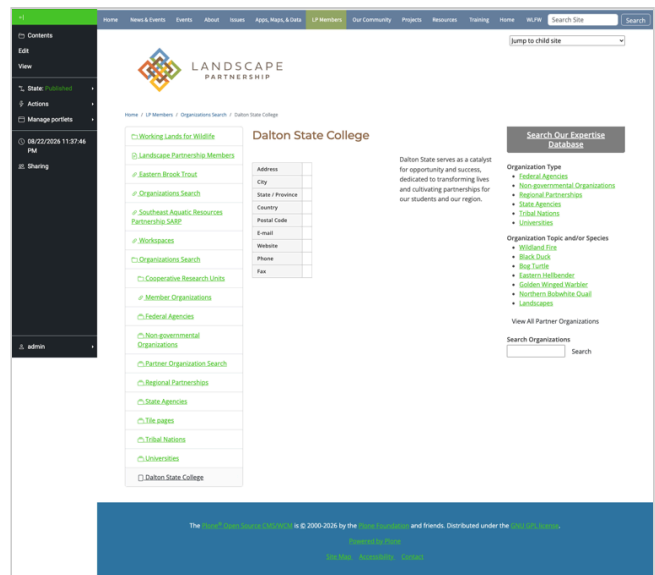

LIVE (dev, 1440)

- typography** `.spatialDetails` now renders as live's compact small print (0.76em / 1.3em — measured 12.16px computed on live, which has no stylesheet rules for this view).
- table** Barceloneta/Bootstrap table chrome neutralized inside the details block: transparent backgrounds, no borders, 2px 8px padding — the label/value rows read as plain text, matching live.
- fidelity** No decoration invented; every value traces to computed-style measurement, documented in `css-notes.md`.

organization — Dalton State College (lp-parent-site)

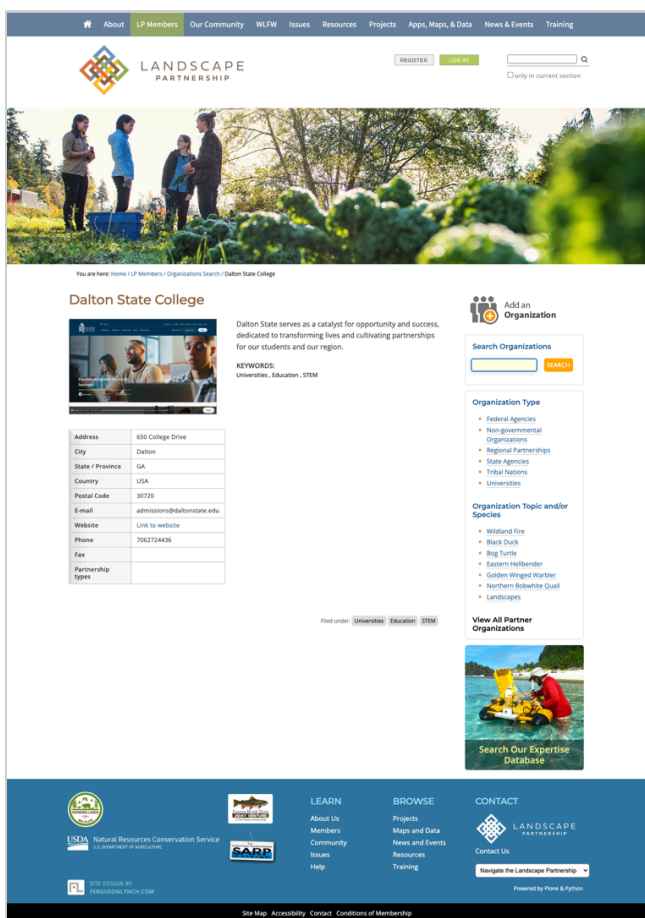

BEFORE (local)

AFTER (local)

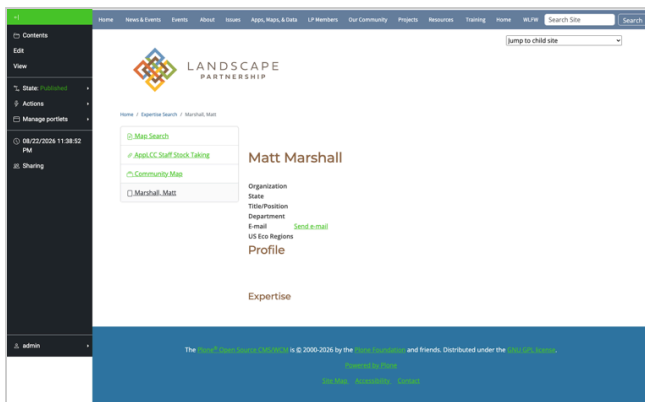

LIVE REFERENCE

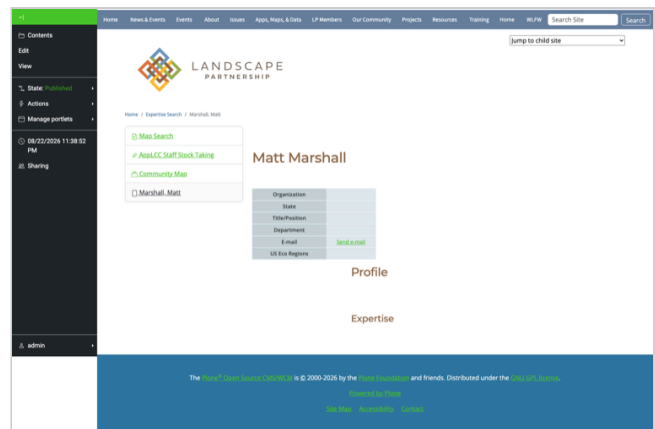

LIVE (dev, 1440)

- `layout` `.flex-container` two-column layout activated: contact column (min-width 350px) beside the description block, stacking to a single column $\leq 768px$.
- `table` Contact table picks up the shared `table.simple` chrome (same rules as product/project — lifted, not duplicated).
- `image` `.org-image img` sized to live's 332px with 1px #ccc border (cell renders empty locally: lead images didn't import — content gap, not CSS).
- `typography` Bare `<label>` field labels bolded (live renders KEYWORDS: bold; Bootstrap/Barceloneta leave bare labels unbolded) — subagent judgment call, validated.
- `markup` Keywords are comma-separated spans in this template (no ul/li) — the product-style list flattening was correctly NOT applied.

person — Matt Marshall (lp-parent-site)

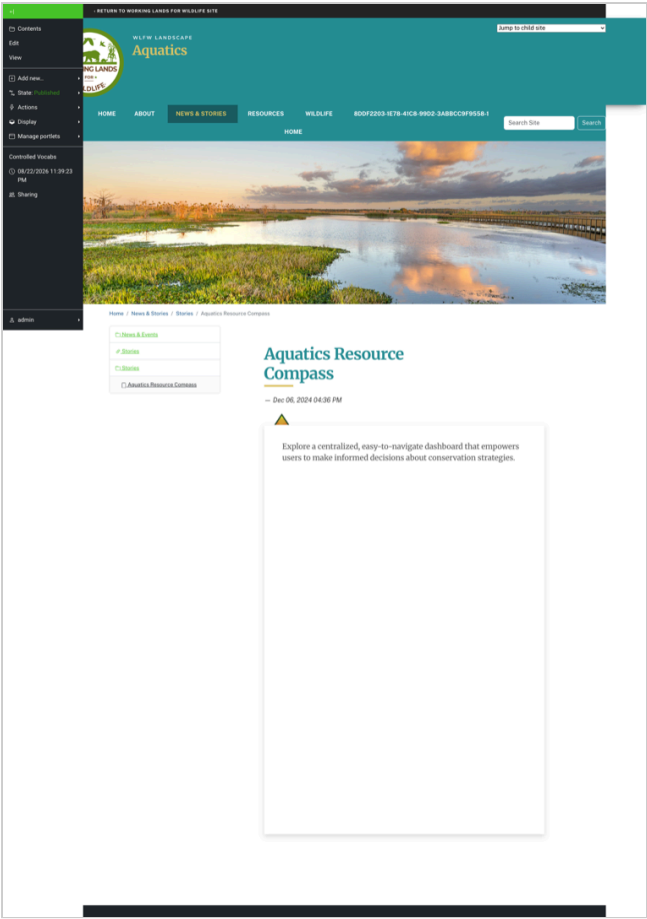

BEFORE (local)

AFTER (local)

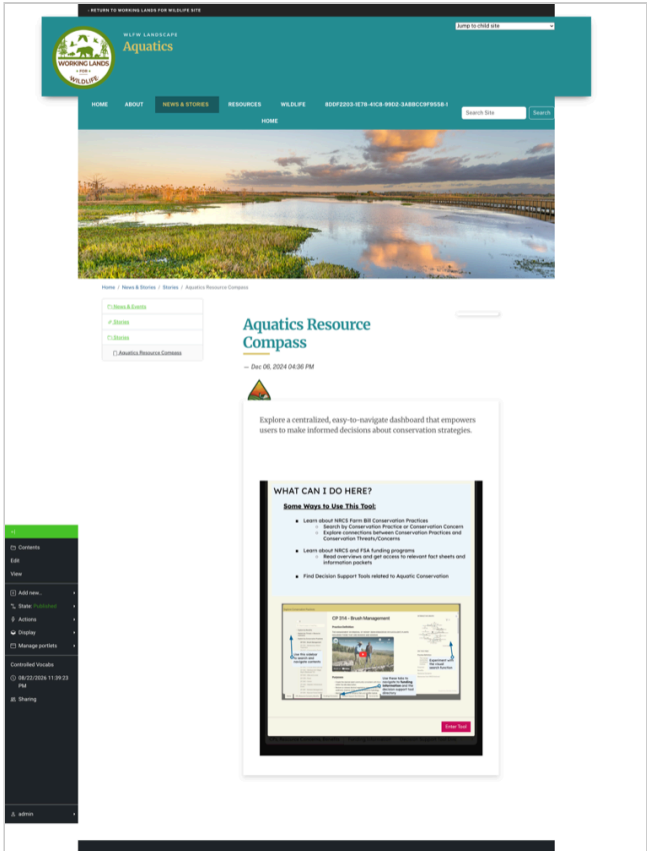

- table** Contact-metadata table gets live's palette: th #c3d1d6, td #dde6ed, #ddeb2 row hover, full-width, wrap-anywhere cells.
- layout** Live's two-column frame restored: #leftcolumn320 (320px, centered photo/contact) + #rightcolumn (700px, profile/expertise), stacking ≤768px (commented as an approximation — live's mobile.css wasn't extracted).
- typography** .objectDetails2 85%/1.3em #333; expertise keywords separated by #dad8d3 right borders per live.
- caveat** NO live visual reference exists yet — /Members/ is private on live and both login attempts with the migration credentials failed. Rules trace 1:1 to extracted ploneCustom.css ; a visual parity pass is deferred and tracked in css-notes.md . Empty Profile/Expertise sections are a field-import gap.

story — Aquatics Resource Compass (aquatics)

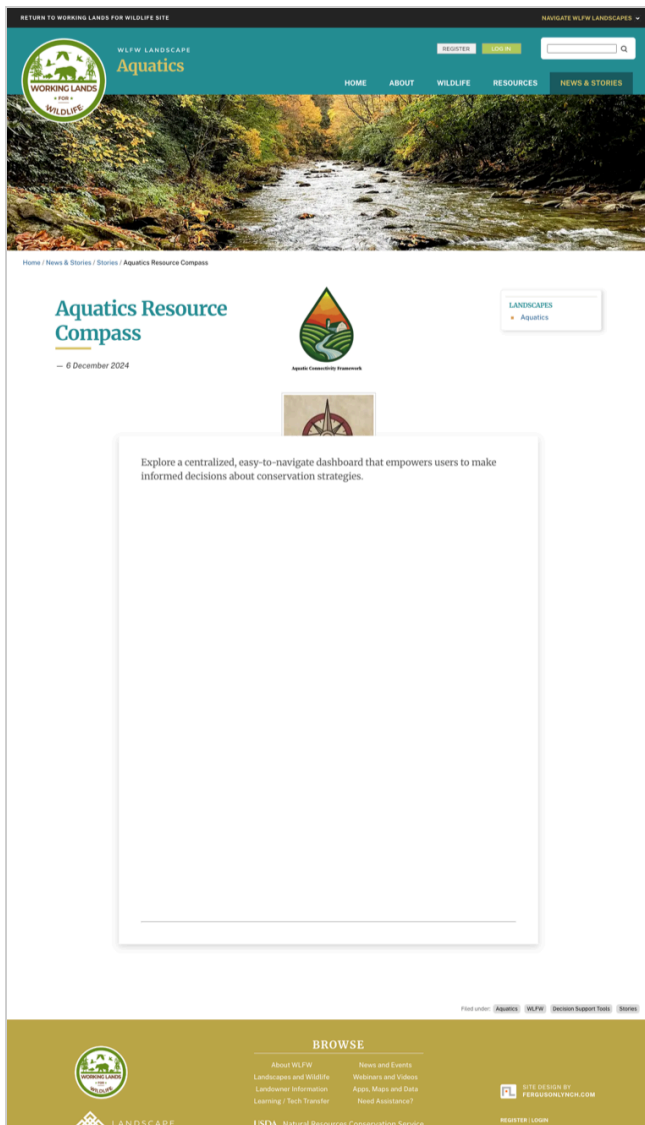

BEFORE (local)

LIVE REFERENCE

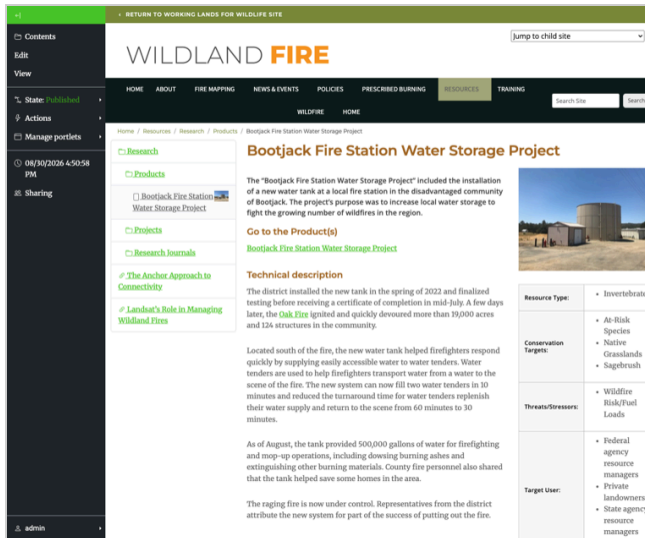

AFTER (local)

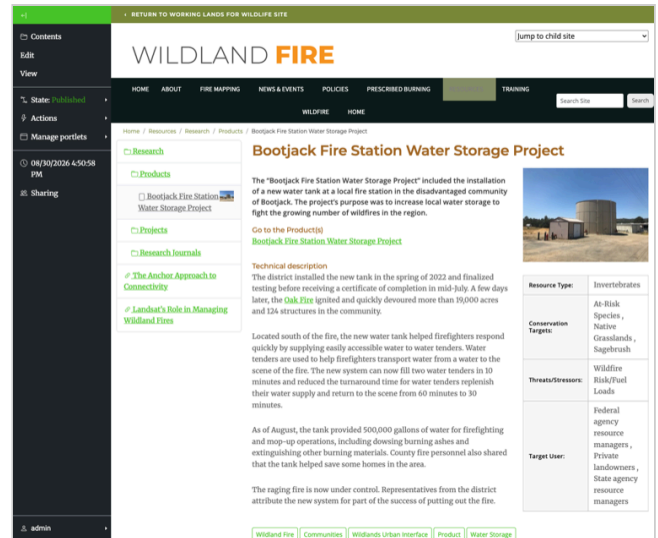

LIVE (dev, 1440)

- **meta** Byline/date line under the title now italic, matching live.
- **layout** `.story-image` full-bleed viewport breakout (the two live !important's kept, documented — they must beat the template's own inline width:768px).
- **card** Sidebar nav card (white, 5px radius, soft shadow) rescope from live's `.template-story_view` rule.
- **discovery** The white content card itself comes from a ~230-line inline style block inside `story_view.pt` that reaches themed pages via each theme's `rules.xml` head-style copy — deliberately NOT duplicated in Layer 1 (subagent finding, validated).
- **flagged** Template bug for lp.content sign-off: inline `.story-image img {{ width: clamp(1280px, 50vw, 90%) }}` has min > max.

product — Bootjack Fire Station (wildland-fire) — prior run, layout now shared

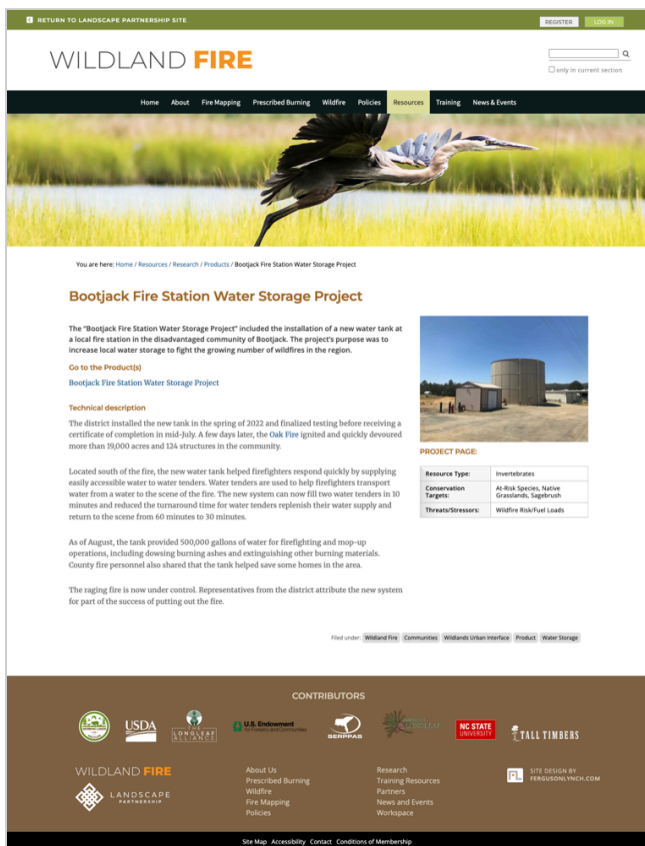

EARLIER (2026-08-30, mid-run: grid applied, lists still bulleted)

FINAL (2026-08-30)

LIVE REFERENCE

LIVE (dev, 1440)

- Styled in the 2026-08-30 pilot (65/35 grid, field headings, table chrome, comma-flattened keyword lists, h5 normalization).
- this run Rules refactored out of `_product.scss` into `_detail-layout.scss` so project and organization share them; compiled output verified unchanged in all 15 themes (regression spot-check per plan §5.3).

Run notes

- Subagent execution: 3 parallel agents (person / spatial+story / organization), disjoint file ownership, no shared-file edits detected at integration (`git status` clean on shared paths); every partial read and validated against the extracted rules before compile. Two agent judgment calls accepted (org label bolding, story card non-duplication), zero rejected.
- Compile verification: all 15 themes rebuilt; all five `portaltype-*` scopes present in every `theme.min.css`.
- Known content gaps (import, not styling): org lead images + contact values, person profile fields, product/project `projNALCC` relations, one 500 page per product/spatial list (`beach-and-tidal-habitat-inventories` , `marine-bird-mapping-and-assessment`).
- Listing displays for every type remain blocked on the FTI `view_methods` + layout-import plumbing (plan: "Container & listing displays"); checklist ticks are object-views-only.
- video: still 0 instances — importer blocked by the `global_allow=False` silent-skip; awaiting decision.
